

Thomas Köllner

Land Use in Product Life Cycles and Ecosystem Quality

Peter Lang

Table of contents

Table of contents	IX
Summary	XIII
Zusammenfassung	XVII
Introduction	1
 PROBLEMS, OBJECTIVES, AND FOUNDATIONS	 5
1 The research process in applied sciences	7
2 The practical problem: Evaluation of land use activities in Life Cycle Assessment	11
2.1 The decision and its context	11
2.2 Framing the practical problem	12
3 Objectives and research questions	15
4 Disciplinary and methodological foundations	17
4.1 Life Cycle Assessment	17
4.2 Ecology and ecological economics	20
4.3 Environmental modelling	20
 ECOLOGICAL EVALUATION OF LAND USE IN LIFE CYCLE ASSESSMENT	 23
5 Conceptual model: land use, ecosystem, and values	25
5.1 Safeguard subject ecosystem quality (EQ)	25
5.1.1 Ecosystem on the landscape scale	25
5.1.2 Attributes of the safeguard subject ecosystem quality	27
5.1.3 Typology of environmental values	32
5.2 Land use activities within the product system	34

5.3	Link between land use and changes in ecosystem quality	35
5.3.1	Endpoint definition: Diversity of the regional species-pool	35
5.3.2	Cause-effect chain between land use and the chosen endpoint	37
6	The impact category <i>land use</i>	41
6.1	Temporal and spatial scale of environmental effects	41
6.2	Marginal and average approach	45
6.3	Assessment perimeter	48
6.4	Reference state	50
6.5	Multifunctionality of land use	51
6.6	Existing proposals for land use impacts in LCA	51
7	Operational model for assessing impacts on biodiversity	59
7.1	Synopsis of the model	59
7.2	Types of values taken into account	62
7.3	Classification of land use types	64
7.4	Land occupation/transformation and assignment of damages	66
7.5	Local characterisation factor: ecosystem damage potentials for species diversity (EDP_{local})	71
7.5.1	Local species richness of specific land use types	72
7.5.2	Results for local effects	83
7.5.3	Transformation of local effects into damage/benefits	91
7.5.4	Results for EDP_{local}	93
7.6	Regional characterisation factor: ecosystem damage potentials for species diversity ($EDP_{regional}$)	97
7.6.1	The study unit Switzerland	97
7.6.2	Regional intensity of land use and species potentially lost	99
7.6.3	Results for regional effects	109
7.6.4	Transformation of regional effects into damage/benefits	120

7.6.5	Results for EDP_{regional}	122
7.7	Total characterisation factor (EDP_{total})	126
7.7.1	Combination of local and regional damage/benefits	126
7.7.2	Results for EDP_{total}	128
7.8	Transformation times	132
7.9	Data uncertainties	134
7.9.1	Monte-Carlo simulation to model data uncertainties	134
7.9.2	Results of the Monte-Carlo simulation	134
APPLICATION OF PROPOSED LAND USE ASSESSMENT METHOD		137
8	Calculating the final damage with exemplary inventory data	139
8.1	Occupation of conventional arable land	139
8.2	Building and using a commercial plant in a forest	141
9	Case study: Land use impact assessment of food products	145
9.1	Land use in the life cycle of food products	145
9.2	Inventory data	146
9.3	Impact Assessment using characterisation factor EDP	148
10	How to integrate one's data on species richness of different land use types	153
DISCUSSION AND CONCLUSION		157
11	Validity, reliability, and uncertainty	159
12	Discussion of validity, reliability, and uncertainty of calculated EDPs	163
12.1	Chosen safeguard subject and its attributes	163
12.2	Land use and local species richness	165
12.3	Land use in the region and species potentially lost	171
12.4	Ecosystem damage potential ($EDP^{\text{sp-div}}$) for species diversity	179

13	Discussion regarding the application of the method	183
13.1	Integrated damage/benefits of ecosystem quality versus changes in ecosystem quality	183
13.2	Use of generic characterisation factors	184
14	Conclusion	185
Appendix 1	CORINE+ land-cover – Nomenclature definitions	189
Appendix 2	Proportion of land use types in Swiss regions	196
Appendix 3	Detailed results of the regression analysis on the regional scale	203
Appendix 4	Assignment of land use types	219
Appendix 5a	Detailed results for local species richness considering all sources	223
Appendix 5b	Detailed results for local species richness considering specific data sources	231
Appendix 6a	Overview with all characterisation factors EDP^{sp-div}	237
Appendix 6b	Results of Monte-Carlo simulation for total EDP^{sp-div} with all the species	240
Appendix 6c	Results of Monte-Carlo simulation for total EDP^{sp-div} with threatened species only	244
Appendix 7	Life Cycle Inventory for the case study	247
	Glossary	249
	Key to acronyms and abbreviations	251
	Key to names of plant species and vegetation types in Latin, English, and German	253
	Literature	255
	Index	267
