

Bond Portfolio Optimization

Ladenpreis: 98,99EUR

ISBN: 978-3-540-76592-9

Auflage: 2008

Verlag: Springer, Springer Berlin

Erscheinungsdatum: 04.01.2008

Autoren: Puhle Michael

Reihe: Lecture Notes in Economics and Mathematical Systems

Details

1 The tools of modern portfolio theory are in general use in the equity markets, either in the form of portfolio optimization software or as an accepted frame- 2 work in which the asset managers think about stock selection. In the fixed income market on the other hand, these tools seem irrelevant or inapplicable. Bond portfolios are nowadays mainly managed by a comparison of portfolio 3 4 risk measures vis-à-vis a benchmark. The portfolio manager's views about the future evolution of the term structure of interest rates translate themselves directly into a positioning relative to his benchmark, taking the risks of these deviations from the benchmark into account only in a very crude 5 fashion, i.e. without really quantifying them probabilistically. This is quite surprising since sophisticated models for the evolution of interest rates are commonly used for interest rate derivatives pricing and the derivation of fixed 6 income risk measures. Wilhelm (1992) explains the absence of modern portfolio tools in the fixed 7 income markets with two factors: historically relatively stable interest rates and systematic differences between stocks and bonds that make an application of modern portfolio theory difficult. These systematic differences relate mainly to the fixed maturity of bonds. Whereas possible future stock prices become more dispersed as the time horizon widens, the bond price at maturity is 8 fixed. This implies that the probabilistic models for stocks and bonds have 1 Starting with the seminal work of Markowitz (1952).
